

Salesforce Project Execution Guide

A Beginner's Step-by-Step Manual for the Rental Property Application

Welcome! Since you are completely new to Salesforce, don't worry. Salesforce is a web-based platform, meaning you won't need to write any code for this project. Everything is done by clicking through menus (this is called "Declarative Development"). Follow these steps carefully.

Prerequisite: Get a Free Salesforce Account

Before you begin, you need a free testing environment. Go to developer.salesforce.com/signup and sign up for a Developer Edition account. Once you verify your email, log in.

Phase 1: Understanding the Workspace

The Setup Menu

Whenever you need to build or modify something in Salesforce, you must be in the **Setup** area.

- Look at the top right corner of your screen for a **Gear Icon** .
- Click it and select **Setup**. A new browser tab will open.
- On the left side, you will see a search bar (Quick Find box). At the top, next to "Home", you will see a tab called **Object Manager**. This is where we will spend most of our time.

Phase 2: Creating Custom Objects (The Database Tables)

In Salesforce, an "Object" is like a spreadsheet tab. We need two: one for Properties and one for Tenants.

Step 1: Create the Property Object

1. Go to **Object Manager** (tab at the top of the Setup page).
2. Click the **Create** button (top right) and select **Custom Object**.
3. Fill in the details:
 - Label: **Property**
 - Plural Label: **Properties**
 - Record Name: **Property Name** (Leave Data Type as Text)
4. Scroll to the very bottom and check the box that says **Launch New Custom Tab Wizard after saving this custom object**.
5. Click **Save**.
6. Choose any icon you like for the Tab Style, click **Next**, **Next**, and **Save**.

Step 2: Create the Tenant Object

1. Go back to **Object Manager** -> **Create** -> **Custom Object**.
2. Fill in the details:
 - Label: **Tenant**
 - Plural Label: **Tenants**
 - Record Name: **Tenant Name** (Leave Data Type as Text)
3. Scroll to the bottom, check **Launch New Custom Tab Wizard**, and click **Save**.
4. Choose a Tab Style, click **Next**, **Next**, and **Save**.

Phase 3: Creating Custom Fields (The Columns)

Fields are the individual pieces of data you collect. You will add these to the objects you just created.

Step 3: Add Fields to the Property Object

From the Object Manager, click on **Property**. On the left sidebar, click **Fields & Relationships**. Then click **New** (top right). Repeat this process for each field below:

Field Label	Data Type to Select	Additional Instructions
Property ID	Auto Number	Display Format: PROP - {0000}, Starting Number: 1
Property Type	Picklist	Select "Enter values manually". Enter types like <i>Apartment</i> , <i>Villa</i> , <i>Studio</i> , <i>Commercial</i> (each on a new line).
Address	Text Area	Just click Next and Save.
Rent Amount	Currency	Just click Next and Save.
Status	Picklist	Select "Enter values manually". Enter: <i>Available</i> and <i>Rented</i> on separate lines.

Note: "Property Name" was already created as a Text field when you made the object.

Step 4: Add Fields to the Tenant Object

Go back to Object Manager, click **Tenant**, click **Fields & Relationships**, and click **New**. Add these fields:

Field Label	Data Type to Select	Additional Instructions
Tenant ID	Auto Number	Display Format: TEN- {0000}, Starting Number: 1
Phone Number	Phone	Click Next and Save.
Email	Email	Click Next and Save.
Move In Date	Date	Click Next and Save.
Property	Lookup Relationship	CRITICAL STEP: This links the Tenant to a Property. 1. Choose <i>Lookup Relationship</i> . 2. Related To: Select <i>Property</i> from the dropdown. 3. Field Label: <i>Property</i> . 4. Click Next until Save.

Phase 4: Building the App

Now we will group your tabs (Properties and Tenants) into a dedicated app so it looks clean.

Step 5: Create the Lightning App

1. In Setup, go to the left sidebar (Quick Find box) and type **App Manager**. Click it.
2. Click **New Lightning App** (top right).
3. App Name: **Rental Property Management** . Click Next.
4. Navigation Style: Leave as Standard Navigation. Click Next.
5. Utility Items: Skip this, click Next.
6. Navigation Items: Search for **Properties** and **Tenants** in the left list. Click the right arrow to move them to the "Selected Items" list. You can also add "Reports" and "Dashboards". Click Next.
7. User Profiles: Select **System Administrator**, click the right arrow to add it, and click **Save & Finish**.

Step 6: Test Your App

1. Click the **App Launcher** (the 9 dots icon in the top left corner of the screen).
2. Search for **Rental Property Management** and click it.
3. You should now see your Properties and Tenants tabs at the top! Try clicking "New" on the Properties tab to add a dummy house.

Phase 5: Reports and Dashboards

Finally, we need to show the analytics requested in your project.

Step 7: Create Reports

1. In your app, click the **Reports** tab.
2. Click **New Report**.
3. Select **Properties** as the Report Type and click Start Report.
4. **Available Properties Report:** In the Filters panel (left side), add a filter: *Status equals Available*. Click Save & Run. Name it "Available Properties Report".
5. **Rented Properties Report:** Create another Properties report. Add a filter: *Status equals Rented*. Save & Run. Name it "Rented Properties Report".
6. **Tenant Details Report:** Click New Report. Choose the report type **Tenants with Properties**. Add columns like Tenant Name, Email, Phone, and Property Name. Save & Run. Name it "Tenant Details Report".

Step 8: Create the Dashboard

1. Click the **Dashboards** tab. Click **New Dashboard**. Name it "Property Management Dashboard".
2. Click **+ Widget -> Chart or Table**.
3. Select your *Available Properties Report*. Choose a gauge or metric chart to show the total number of available houses. Click Add.
4. Repeat this to add components for Total Properties (use a report without filters), Total Tenants (use Tenant Details report), and Occupied Houses (use Rented Properties report).
5. Click **Save** and **Done**.

Congratulations! You have successfully built your first Salesforce Cloud Application.
